

Stay ahead of cyber threats with a Next Gen Firewall

A good firewall is the cornerstone of any secure network. It will stop advanced cyberattacks, as well as keep up with the speed, performance, and productivity demanded by today's busy dental practices. But did you know that if you aren't using a Layer 7, Next Gen Firewall System, you are still wide open to hackers around the world who start their day with a cup of coffee and an evil plan to steal your data!

You might ask: I already have a Firewall. Why do I need to upgrade?

The answer is not all firewalls are created equal. Consider two airport security approaches. One checks to make sure passengers are not on any no-fly lists, that their identities match what is listed on their tickets, and that they are going to destinations the airport actually services. The second one, in addition to checking these requirements, inspects what the passengers are carrying, making sure they do not have dangerous or prohibited items. The first agency keeps airports secure from obvious threats while the second also identifies threats that may be less obvious.

At HTI, we recommend that a Next Generation Firewall must include the following:

- ✓ Enhanced Security with Threat Intelligence
- ✓ Capture ATP (Advanced Threat Protection)
- ✓ Intrusion Prevention
- ✓ Application Awareness

Yes, it very "techie", but rest assured one of the most effective ways to prevent zero-day attacks that you hear in the news is deploying a Next Gen Firewall that reviews all incoming traffic and filters out malicious signatures that target security vulnerabilities. Our CISCO certified security operations team overseas the installation, maintenance, and updates on all our Firewalls networks and are available to answer specific security questions you may have.

At HTI, our goal is to protect your computer system and valuable data.
